

(a) $E[Q(k)]$ calibration curve — Phase 1 (Exp 6)
HedgeTuned $k^\dagger^*$ identification from 28 vulnerable sessions

(b) Per-stage circuit completion under each defense (Exp 5, $n=20$)
corrected metric — HT-rejected calls excluded from Stages A/C/D/Def 4

† Corrected: $k^\dagger^*=1 \Rightarrow \leq 1$ successful call per session $\Rightarrow$ no rising AMBR sequence possible. Raw as4_only A=55%, FL=45%; corrected=0%. ‡ ISO Stage C (85%) is raw — agents still claim success without contaminated readback; escalation (Stage D) collapses to 0% because readback is severed.
